Flytec 5020/5030 / Bräuniger Compeo/Competino Communication Definition

Last update: 01.04.2005

Introduction

This document is valid for the following instruments: Flytec 5020/5030 and Bräuniger Compeo/Competino. The term “Instrument” is used, where the definition is valid for every device mentioned before. In case of differences between devices, every definition is referenced by the device name.

The instrument is equipped with special communication features, in order to communicate with external devices.
It is possible to transfer data in both directions, so efficient handling during competitions is guaranteed.
The high speed interface with 57.600 baud allows quick transfers with only short delays.

Via RS232 it is possible to communicate with the instrument.
Communication includes:

- Get Serialnumber and pilotname
- Get the actual stored waypointlist
- Get the actual stored routeslist
- Get a selected track, tracklist
- Put waypoints into the instrument
- Put routes into the instrument
- Handle Flight restricted areas (CTRs)

Interface Settings

The instrument receives and transmits data with the following format:

- 57.600 baud
- 1 start bit
- 8 data bit
- 1 stop bit
- no parity

- Software handshake XON / XOFF for flow control

General dataformat

ASCII data are accepted and transmitted as the only valid data format. All data are packed into different NMEA-sentences with a propriatary identifier. The only exception are the track data, which are sent directly in the IGC-format, which is requested by the FAI.

Handshake

XON / XOFF is used to control data flow in both directions.

If the instrument receives a valid command from the PC, it sends an XOFF (13h) character. After the command is completely processed, (e.g. an IGC-file is sent) the instrument sends the XON (11h) character.

Requesting the Serialnumber and the Pilotname

The instrument has to be set into MENU-mode.

Sending waypoints to the instrument

The instrument has to be set into MENU-mode.

Inside the instrument, all waypoints are referenced by its name, which is always 17char long. If a waypoint is received, its name is compared with the internal waypoints. If a name matches, the original waypoint is overwritten.
If no match is found, the new waypoint is added to the internal list.
If a waypoint is stored, a short acceptance beep is output. The acoustic therefore should not be switched off!
The XON / XOFF protocol allows a transfer of up to 200 waypoints in sequence.
Waypoints may be transmitted in compatible or in native notation.

1. Compatible notation:

1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2

Sending routes to the instrument

The instrument has to be set into MENU-mode.
Before sending any route, be sure that the waypoints are known by the instrument. So transmit the waypoints before they are referenced by any route.
Inside the instrument, all waypoints are referenced by its name, which is always 17char long. If a valid route is received, its name is compared with the internal route names. If a name matches, the original route is overwritten.
If no match is found, the new route is added to the internal list.
If a route is stored, a short acceptance beep is output. The acoustic therefore should not be switched off!
The XON / XOFF protocol allows a transfer of up to 20 routes with up to 30 waypoints in sequence.

Important: Route No 00 is defined as COMPETITION-ROUTE and is specially treated inside the instrument. Please inform yourself inside the owners manual for further information.

First sentence

If AA is equal 00, NNNN is ignored, because it is fixed to COMPETITION-ROUTE.
If NNNN is omitted, the instrument uses AA to use the name as --------AA-------.

Reply of the instrument:
The answer of the instrument consists of data defined in IGC-format. Every line is ended with CrLf sequence.
Be sure to store every received character into a file with the ending .IGC . If data are altered or added, the G-record will indicate manipulation.
Exceptions: HP- and HO-records. L-records with as LBRA – origin.
Transmission is framed with a start and stop beep. The acoustic therefore should not be switched off!
Use timeout of e.g. 0.5s for ending reception.

Sending CTRs to the instrument:

The instrument has to be set into MENU-mode.
Inside the instrument, all CTRs are referenced by its name, which is always 17char long. If a valid CTR is received, its name is compared with the internal CTR names. If a name matches, the original CTR is overwritten.
If no match is found, the new CTR is added to the internal list.
If a CTR is stored, a short acceptance beep is output. The acoustic therefore should not be switched off!
Up to 500 CTRs with up to 100 waypoints in sequence are accepted. (depends on available memory)
Be sure that the points and segments describe a surrounding polygon!

Output of cyclic NMEA-Data

The instrument allows the cyclic (1s update) output of different NMEA sentences for interfacing other devices like cardplotters, autopilots, etc.

Interface settings of receiving device: 9600baud, 8 n 1(internal GH80 receiver only)

Restrictions: The cyclic output is interrupted, if in Menu-mode. If a flight track is redrawn in the realtime track, no data are output during a complete redraw. No output is produced, if the GPS-module is switched off.

$BRSF(you need a release code for this sentence)
Example:
$BRSF,063,-013,-0035,1,193,00351,535,485*38

Definition	**Example**	**Unit**
Identification	$BRSF,	
Indicated or true air speed	063,	63 km/h

Integrating vario	-013,	-1.3 m/s (+ xxx if rising)
Altitude A2	-0035,	-35 m (+ xxxx if positiv)
Waypoint activ	1,	1 activ, 0 not activ
Bearing to waypoint	193,	193°
Distance to waypoint	00351,	35.1 km
McCready speed to fly	535,	53.5 km/h
Speed to fly (best glide)	485	48.5 km/h
Checksum	*38	As defined by NMEA

$VMVABD
Example:
$VMVABD,0000.0,M,0547.0,M,-0.0,,,MS,0.0,KH,22.4,C*65

Definition	**Example**	**Unit**
Identification	$VMVABD,	
GPS Altitude	0000.0,M,	Meter
Baro Altitude (A1)	0547.0,M,	Meter
Integrating vario	-0.0,,,MS	m/s
Indicated or true air speed	0.0,KH,	km/h
Temperature	22.4,C	°C
Checksum	*65	As defined by NMEA

Using VALI-BRA.EXE

The Console application allows official observers to test the integrity and possible manipulation of IGC- files, transferred from the instrument.
VALI-BRA uses all data of the file except the following additional records:

- HO and HP- records, where official observers or pilots can make input in the header section

- L –records, which following 3 characters are not BRA. This allows individual logbook-entries.

Calling convention:
VALI-BRA “igc-file”

The text out informs about validity or manipulation or corrupt files.

In order to execute VALI-BRA in batch- mode, the return value can be evaluated:
0: data are valid
1: data are not valid, corruption or manipulation
2: bad or missing file when VALI-BRA is called

Reading and writing EEPROM-memory

The instrument has to be set into Menumode.

Requesting memory dump:

PC sends request:
